

- 1 **Reportyak B2B Client Acquisition Booklet**
(Submitted to fulfill the "end-to-end deck" requirement, as this functioned as our primary outbound B2B sales presentation).

What I designed and art-directed: I was solely responsible for the core concept, main design direction, layout architecture, and overall visual execution. I designed the booklet end-to-end from a blank canvas, structuring how to visualize dense corporate reporting capabilities into a scannable, persuasive layout without relying on pre-existing templates.

What the team did: Reportyak's strategy and leadership teams provided the raw copy, business metrics, and target audience parameters.

Business Impact: This booklet served as the company's leading client-acquisition tool and successfully secured ₹35 Lakhs in new client contracts.

- 3 **E-Waste Hazard Data Visualization**
(Submitted to fulfill the "charts built from raw data" requirement).

What I designed and built: I personally aggregated the raw statistics, structured the information architecture, and designed all the charts and visualizations from scratch. The goal was to translate dense statistical information into an accessible, engaging visual narrative to raise public awareness about e-waste.

Where the data came from: I manually sourced and accumulated the raw data directly from official reports across various major government websites and departments.

What the team did: An academic professor provided high-level guidance on data structuring, methodology, and feedback on the final visual execution.

- 5 **Project: Haystack Analytics – Web Platform Revamp**
(Submitted to fulfill the "website you designed and shipped" requirement).

What I designed: I led the extensive UI/UX revamp and redesign of the company's web platform. Over an intensive two-month engagement, I executed the complete design phase, delivering a finalized design system and page layouts that were formally approved and accepted by stakeholders.

What the team did: At the end of my two-month tenure, I handed the approved design assets over to the internal development team, who are currently handling the technical implementation. The final live deployment is actively pending their build.

- 2 **Architecture Portfolio – CAD & BIM Technical Visualizations**
(Submitted to fulfill the "technical illustration" requirement).

What I designed and built: I personally executed all CAD drafting, 3D BIM modeling, and the final technical visualizations. I translated structural constraints and spatial data into precise architectural cutaways, system schematics, and accurate technical drawings.

What the team did: Senior architects and academic professors provided the initial project parameters, foundational structural guidance, and high-level review to ensure technical feasibility.

Why it fits: While architectural rather than chemical, these pieces demonstrate my direct capability to take complex spatial, dimensional, and structural concepts and translate them into rigorous, millimeter-accurate technical illustrations.

- 4 **Haystack Analytics – Customer Medical Report Design**
(Submitted to fulfill the "one-pager or spec sheet" requirement).

What I designed and built: I led the major visualization and overall layout design. I was responsible for taking highly complex, dense medical data—including detailed clinical tables—and condensing it into a strict fixed-page format. I designed the visual hierarchy to ensure that maximum page utilization did not compromise readability, making technical health data accessible and easy for patients to understand.

What the team did: The medical and product teams provided the raw clinical data and text. They also spent time walking me through the complex medical concepts and outlined the strict clinical and regulatory restrictions the design had to adhere to.

- 6 **Elix – Brand Identity System (Concept Project)**
(Submitted to fulfill the "brand or template system" requirement).

What I designed and built: I developed the complete visual identity and brand strategy for this hypothetical premium spirits brand. Working within a two-person team, I personally created the logo, executed the custom packaging illustrations, and built the foundational branding guidelines and asset library.

What the team did: My project partner collaborated on the overarching brand strategy and utilized the design system I provided to build out the final project presentations and conceptual mockups.

How it was used without me: I structured the design files and established strict visual rules for the identity. This organized system allowed my teammate to independently and accurately apply the logo, typography, and packaging graphics to their portion of the deliverables without needing my direct supervision or continuous hands-on adjustments.
