

Haystack Analytics – Medical Data Reporting

The Brief: Redesign the presentation of complex genomics and medical analytics into accessible, highly visual reports for patients without diluting the underlying scientific accuracy.

The Constraint: Fitting dense clinical tables into a strict fixed-page layout, with the critical challenge that the complex genetic visualizations had to be entirely self-explanatory for the end consumer, as no medical professional would be present to interpret the results for them.

What I would do differently: I would have spent more time early on stress-testing the fixed layouts with extreme edge cases of patient data (e.g., unusually long medical terms, extensive footnotes, or missing data points). Building stricter character-limit rules and flexible text boxes from the start would ensure the visual hierarchy never breaks when populated with unpredictable, real-world clinical data.

Reportyak – “The Field Guide” B2B Client Acquisition Booklet

The Brief: Design an end-to-end outbound B2B sales booklet titled “The Field Guide to Creating Great Reports”. The goal was to visualize what separates a great report from a standard one by defining core principles like “Set Your North,” “Chart the Journey,” and “The Dual Lens”.

The Constraint: I had to synthesize dense corporate case studies and reporting frameworks into a highly scannable layout where narrative text and impactful data visualizations work in tandem to serve both deep readers and quick skimmers. Additionally, the design had to be optimized for physical distribution, requiring careful alignment of paper choices with controlled ink usage and reduced dark backgrounds to manage weight and logistics.

What I would do differently: While the booklet successfully secured ₹35 Lakhs in new client contracts, I originally designed the file as a static piece. To prevent future drawbacks like weak typographic structure, text-heavy pages, or inconsistent financial presentations when the strategy team updates data, I would build it using strict component rules and master paragraph styles—such as locking text sizes and keeping body copy under 80 characters per line—from the very beginning.
